What is...

MULTIZERO

The new standard in adjustment mechanics allows the shooter to sight the gun in at five different distances. Alternatively, the multiple zero settings can be used for various bullet types or loads at selected distances.

Mode A

Standard turret mode.

Mode B

Micro-clutch disconnects turret from spindle. Mode B defines a fully adjustable elevation window of one full revolution from base zero setting. Mode B is used only one time during the multi yardage sighting in process — to set the base sight setting.

Mode C

Mode C allows four additional sight settings for further shooting distances using four independently adjustable index rings — always aiming right through the center of the crosshair.

Fine clicks between the fully adjustable index marks allow total flexibility and tightest groups under field conditions.

Note: MultiZero is not available with Tactical Turrets.
